### Clonal Rootstock Production Trial\*

G.S. Bender and M.L. Arpaia

In May, 1986 the first phase of an avocado rootstock trial was established at South Coast Field Station. This planting consists of 'Hass' variety grafted on 10 rootstocks: G755A, G755B, G755C, 1033, Thomas, Borchard, Toro Canyon, D9, Duke 7 and Topa Topa. A companion planting using 'Gwen' as the variety will be planted in April, 1987. The results from this trial will provide horticultural information on rootstock influence, if any, on yield, precociousness, fruit quality and tree vigor.

\* This project is funded in part by the California Avocado Commission.
